

## **IV Vitamin C Informed Consent**

Vitamin C aids in the regeneration of oral tissues, and has been recommended by Dr. Wall to aid in your oral rehabilitation. Numerous studies have shown the benefits of vitamin C in fighting periodontal disease (gum disease), gingivitis, promoting bone and teeth health, and improving general oral immune health.

I understand that this procedure is not considered “routine and customary.” However, I feel that it may be beneficial in my particular case, and I give my consent to the administration of IV vitamin C.

Patients who have the following conditions should NOT have IV vitamin C:

- Uncontrolled diabetes
- Kidney disease or nephritic syndrome
- Reduced kidney function
- Urinary tract infection
- History of anemia due to G-6-PD deficiency
