NIGHTLASE

Someone keeping you awake?
Wish you were wearing ear plugs?
Want to stuff a pillow in the hole?
Wonder when morning will come?

NONSURGICAL SNORING TREATMENT

The NightLase procedure is one of many laser procedures offered at Dental Solutions.

The Lightwalker ATS is the workhorse that drives the NightLase procedure. In just 3 visits, with minimal discomfort, your snoring can be greatly reduced or eliminated. Touch up treatments may be needed every 6-18 months, depending on tissue response.

The Er:YAG laser gently renatures collagen. The resulting effect is a smaller soft palate (the part of the mouth usually responsible for snoring sounds). Over time, collagen, or the material that makes up the inside of the mouth, loses its stiffness and becomes flaccid. The Er: YAG laser firms the tissue and reduces sound made

The diagram shown above depicts airway size. The closer the soft palate gets to the tongue, the smaller the airway and the greater potential for snoring. A class I airway is much more beneficial than a class IV airway, for example. The goal of NightLase treatment is to increase airway size and decrease tissue turbulence. Going from a class IV to III, or from a class III to I would be considered successful treatment.
